

Antigravity AI Cold-Start Handover Specification

Zero-Context AI Reconnection, Project Onboarding & Autonomous Development Prompt

Target Domain: AI Continuity & Project Handover	Specification Version: v1.0.0 (Production)
Repository: github.com/erdipu/enterprise-infrastructure-monitoring	Production Host: deepak-monitoring.duckdns.org (80.225.252.145)
Cold-Start Onboarding Time: < 2 Minutes	AI Model Compatibility: Antigravity 2.0 / Gemini Pro Coding Agent
Required User Action: Copy & Paste Master Prompt	Security Policy: Zero Secrets Exposed / Full Parameterization

1. Purpose & Cold-Start Resilience Principles

If you format your computer, lose this conversation, or start a completely fresh AI coding session in Google Antigravity, the agent starts with zero memory of past chats. However, because our entire platform architecture, database schemas, edge daemons, and disaster runbooks are fully committed to GitHub, **Antigravity can onboard autonomously and resume development immediately** when provided with the structured handover prompt on Page 2.

Why This Guarantees 100% Continuity:

- **Self-Documenting Codebase:** All 7 Docker services, 2 edge daemons, and 8 database tables are version-controlled.
- **Deterministic Onboarding:** The prompt commands Antigravity to clone the repository, read the architecture guides, and inspect git status.
- **Zero Risk of Secret Leakage:** Sensitive passwords and private keys are never passed into public repositories.

2. What Is Required From Your Side (Prerequisites Checklist)

Before pasting the master prompt into a new Antigravity session on a freshly formatted PC, ensure you have these 4 items ready:

Prerequisite Item	What You Need To Have Ready	Where To Place It / How To Provide It
1. GitHub Account & Access	GitHub username (erdipu) and Personal Access Token (PAT) with repo write scope, or SSH key configured on GitHub.	Run git clone https://github.com/erdipu/enterprise-infrastructure-monitoring.git or sign in via Git credential helper.
2. Cloud Server SSH Key	Private key file ssh-key-2026-10-08.key (obtained from your Bitwarden Vault or encrypted USB cold storage).	Place in ~/.ssh/ssh-key-2026-10-08.key on your PC and run: chmod 600 ~/.ssh/ssh-key-2026-10-08.key.
3. Secrets & Bot Tokens	• Telegram Bot Token & Chat ID (@my_infrastructure_alert_bot) • Fast2SMS API Key & Phone Number • Gmail SMTP App Password & DuckDNS Token	Preserved safely in Bitwarden Password Manager or encrypted vault platform_secrets_backup.enc.
4. Development Tools	Installed on your fresh PC: • Git, Python 3.10+, and Docker Desktop • Google Antigravity IDE / CLI	Installed via brew install git python3 docker (macOS) or package managers on Windows/Ubuntu.

3. The Master Cold-Start Prompt for Antigravity

Copy the prompt text below and paste it as your **very first prompt to Antigravity**. Replace the bracketed text at the bottom with your specific desired change or feature request:

Hello Antigravity. I am the lead engineer for the Universal Device & Service Monitoring Platform. My PC was formatted / my previous conversation was cleared, and I need you to onboard onto this project, inspect its codebase and live hybrid cloud deployment, and assist me with developing and updating it.

1. PROJECT OVERVIEW & REPOSITORY

- GitHub Repository: <https://github.com/erdipu/enterprise-infrastructure-monitoring.git>
- Production Host: <http://deepak-monitoring.duckdns.org> (Oracle Cloud OCI VM 2: 80.225.252.145)
- Local Workspace: Clone or open 'enterprise-infrastructure-monitoring' in your scratch workspace.

2. ARCHITECTURE & TECHNOLOGY STACK

- Edge Network (On-Premises): TP-Link TL-WR845N (Target 1: 192.168.1.7, AP Mode) hardwired to ZTE F670LV9 Gateway. Transmits UDP 514 Syslog telemetry through CGNAT to Cloud VM 2.
- Telemetry Daemons:
 - router_syslog_exporter.py: UDP 514 syslog receiver & Prometheus metrics exporter on port :9125.
 - router_watchdog.py: 7-stage multi-target escalation engine (Telegram, SMS, Email).
- Core Observability Stack (Docker Compose):
 - PostgreSQL 15 (monitoring_db with 8 tables: users, servers, monitoring_targets, incidents, alerts, comments, audit_logs, notifications).
 - Prometheus (:9090), Alertmanager (:9093), Grafana (:3000), Node Exporter (:9100), Blackbox Exporter (:9115).
 - Backend API (:5000) & Custom NOC Portal Frontend (:8090).
- Production Server Daemons: Running 24/7 on Ubuntu 22.04 (ubuntu@80.225.252.145) under systemd.

3. KEY DOCUMENTATION TO READ FIRST

Please read the following documents in docs/ before making changes:

1. README.md - Master portfolio documentation and emergency checklist.
2. docs/ENTERPRISE_SYSTEM_ARCHITECTURE.md - Live hybrid cloud architecture and CGNAT traversal.
3. docs/DISASTER_RECOVERY_PLAN.md - Master DRP and 3-2-1 backup strategy.
4. docs/PROJECT_SETUP_GUIDE.md - Complete server and local deployment instructions.
5. docs/DATABASE_RECOVERY_GUIDE.md - PostgreSQL schema and backup/restore scripts.

4. STRICT SAFETY & ENGINEERING RULES

1. Never commit secrets: Never commit private keys (*.key, *.pem), passwords, or API tokens to Git.
2. Zero-downtime on Production: Do not restart or modify production containers or daemons without verifying locally first.
3. Always take pre-change backups: If modifying the database, run scripts/backup_database.sh before running migrations.
4. Synchronize GitHub and Cloud: Any changes committed to GitHub must be cleanly pulled onto Cloud VM via SSH.

5. MY IMMEDIATE REQUEST

Please first verify that you have cloned or navigated to the repository, inspect git status and the directory layout, verify your understanding of the architecture, and then help me with:

[DESCRIBE YOUR DESIRED CHANGE OR TASK HERE]

4. Antigravity AI Autonomous Execution Protocol

When Antigravity receives this prompt in a new conversation, it automatically follows this 5-stage protocol:

Stage	AI Action & Tool Execution	Verification Criteria
1. Workspace Discovery	Checks local directory. If empty, runs git clone https://github.com/erdipu/enterprise-infrastructure-monitoring.git.	Clean Git tree on branch main.
2. Architectural Ingestion	Reads README.md, ENTERPRISE_SYSTEM_ARCHITECTURE.md, and Docker Compose configurations.	Maps 8 PostgreSQL tables, 7 containers, 2 daemons.
3. Cloud & Safety Verification	Verifies SSH key ~/.ssh/ssh-key-2026-10-08.key and tests cloud connectivity: ssh ubuntu@80.225.252.145 "docker ps".	Production containers active and healthy.
4. Implementation & Testing	Edits project files, scripts, or schemas. Runs local test suites and verifies changes before touching production.	Zero broken dependencies or syntax errors.
5. Dual-Sync Deployment	Commits changes to GitHub with git push origin main and pulls cleanly on VM 2 via SSH.	GitHub and Cloud VM 2 in 100% lockstep.

5. Example Change Requests You Can Attach to the Prompt

Replace [DESCRIBE YOUR DESIRED CHANGE OR TASK HERE] in Section 5 of the prompt with any of these sample tasks:

Objective	Ready-to-Use Prompt Snippet
Add New Monitoring Target	"Add an HTTP health check probe for https://api.mycompany.com in prometheus/blackbox.yml and add a P2 alert rule in prometheus/alert.rules.yml if response time exceeds 500ms."
Modify Alert Thresholds	"Change the router watchdog offline threshold from 3 missed pings to 5 missed pings, and adjust the Telegram notification cooldown from 5 minutes to 15 minutes."
Update Frontend Dashboard	"Add a new metric card in frontend/index.html that displays 24-hour resolved incident counts and real-time router link latency graphs."
Perform Full Production Audit	"SSH into 80.225.252.145, check Docker container health, review systemd logs for router-watchdog.service, and verify that the nightly cron backup ran successfully."
Database Schema Migration	"Create an automated safety backup using scripts/backup_database.sh, then add an 'ip_address' column to the monitoring_targets table in schema.sql and backend models."
